Schreiber, David

From:

Epps-Ford, Janet Thursday, March 10, 2005 4:59 PM Schreiber, David Sent:

To: Subject:

sequence search request

PLease search SEQ ID NOS: 59-65 of application 08/901,612, each sequence is under 30 nucleotides in length. Search all pending and published nucleic acid sequence databases.

Thanks,

Janet L. Epps-Ford, Ph.D.

The present sequence represents a synthetic oligonucleotide HBV88Mb which is complementary to a portion of the hepatitis B vins (HBV) RM. The antisense oligonucleotide may be used to detect the presence of HBV in a sample. The antisense oligonucleotide, and oligonucleotides containing a sequence which is complementary to at least two non-contiguous regions of an HBV nucleic acid, may be used for inhibiting HBV replication in a cell or for the treatment of HBV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Oligo:nucleotide(s) complementary to hepatitis B virus (HBV) sequences used in the detection and treatment of HBV infection.

The present invention relates to hepatitis B virus (HBV) strain FRI, genotype G DNA encoding PreCore/Core protein, HBpol, envelope (PreSI, preS2 and surface antigen HBBAG) and HBX proteins. HBV genotype G nucleic acids and polypeptides are useful for diagnosing, prognosing and treating infections caused by HBV genotype G. They can be used in a vaccine to treat or prevent HBV genotype G. They can be used in a vaccine to treat or prevent HBV genotype G infection. The HBV genotype G derived nucleic acids and antibodies are useful for detecting HBV genotype G in a sample or diagnosis of HBV genotype G infection. The presence of HBV genotype G statistically correlates with the presence of liver damage and/or liver cancer in the subject. The HBV genotype G ore insert peptide encoding nucleic acid is useful for designing monitoring assays to study and predict the evolution of anti-HBe and anti-HBC antibodies and HBAAG (genotype G antigen) in patients infected with HBV. The antibodies or antigens of HBV genotype G are useful for identifying a stage of liver disease caused by HBV genotype G DNA fragment encoding e a hepatitis B virus (HBV) strain FRI, genotype G DNA fragment encoding e
                                                                                                                                                                                                                                                                                  Novel hepatitis B virus genotype G, nucleic acids encoding virus, polypeptides encoded by nucleic acids, useful for preparing vaccine to treat or prevent the hepatitis B virus genotype G infection in a subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match 100.0%; Score 30; DB 4; Length 87; Best Local Similarity 86.7%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Screening of antiviral agents by protein-priming activity of hepatitis B virus DNA polymerase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a method of screening for an antiviral agent by the protein-priming activity of hepatitis B virus (HBV) DNA polymerase. Also described is developing an antiviral agent with a high selectivity to HBV which can be used for high-throughput screening. The present sequence represents an RNA oligonucleotide which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      HBV genotype G; precore; HBpol; polýmerase; envelope protein; preSl; preS2; surface antigen; HBsAg; HBX protein; vaccine; HBeAg; liver disease; hepatitis; liver cancer; HBcAg; core antigen; ds.

The present invention relates to hepatitis B virus (HBV) strain FRI, genotype G DNA encoding PreCore/Core protein, HBpol, envelope (PreSi, PreSi and surface antigen HBsAg) and HBX proteins. HBV genotype G nucleic acids and polypeptides are useful for diagnosing, prognosing and treating infections caused by HBV genotype G. They can be used in a vaccine to infection cause and antibodies are useful for detecting HBV genotype G derived anucleic acids and antibodies are useful for detecting HBV genotype G in a sample or diagnosis of HBV genotype G infection. The presence of HBV genotype G statistically correlates with the presence of liver damage and/or liver cancer in the subject. The HBV genotype G core insert peptide encoding nucleic acid is useful for designing monitoring assays to study and predict the evolution of anti-HBe and anti-HBc antibodies to study and predict the evolution of anti-HBe and anti-HBV. The and HBAP (genotype G antibodies or antigens) in patients infected with HBV. The attage of liver disease caused by HBV genotype G. The present sequence is a hepatitis B virus (HBV) strain FRI, genotype G DNA fragment
                                                                                                                                                                             Novel hepatitis B virus genotype G, nucleic acids encoding virus, polypeptides encoded by nucleic acids, useful for preparing vaccine to treat or prevent the hepatitis B virus genotype G infection in a subject.
                                                                                                                                                                                                                                                                                     Claim 5; Page 57; 84pp; English.

```
The invention relates to modified proteins comprising hepatitis B virus (HBV) core antigen (HBCAg) wherein one or more of the four arginine repeats has been deleted and the protein comprising the C-terminal cystaine of HBCAg. The deleted region may be replaced by an epitope from a protein other than HBCAg, in which case the HBCAg acts as a carrier to present the epitope to the immune system. This chimmer protein or its nucleic acid is useful as a vaccine or in a method of prophylactic or therapeutic vaccination of the human or animal body, particularly against HBV. The nucleic acid encoding the protein may be used in gene therapy or DNA vaccination protocols. The chimeric protein or its nucleic acid may also be used as the basis of a prophylactic vaccine against a range of diseases, e.g. HBV, hepatitis A virus (HAV), influenza, foot-and-mouth disease, polio, hepatitis C virus (HCV), influenza, foot-and-mouth disease, polio, hepatitis C virus (HCV), influenza, whooping cough, salmonellosis, vyphoid, food poisoning, diarrhoea, meningitis or gonorrhea. The present sequence is a DNA encoding Hepatitis B virus core antigen (HBCAg)
                                                                                                                                                                                                       vaccine in prophylactic or therapeutic vaccinetion of the human or animal body, particularly against hepatitis B virus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 639 BP; 147 A; 161 C; 141 G; 190 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT 9
```

This genotype was found with a high prevalence in patients chronically infected with HBV and residing in Europe and the USA. The invention relates to a fully defined sequence of 3248 nucleotides as given in specification, a sequence with 92% identity to the given sequence, or sequence that is degenerate to the mentioned sequences. These polynucleotides are useful for HBV genotyping. The proteins encoded by the polynucleotides are useful for HBV genotyping. The proteins encoded by the proteins are useful for detecting antibodies in a biological sample. Ligands that bind to the proteins and antibodies directed against HBCAg and HBCAg (precore precursor proteins). They are also useful for preparing a vaccine or medicament for treating HBV infections. The present sequence is provided in an alignment of precore/core sequences of an HBV genotype A strain (HBVXCPS) and 7 strains (FR1, FR2, US1, US3, US6, US7, US9, US10) of HBV genotype G \$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$

Novel isolated and/or purified hepatitis B virus polypeptide and polynucleotide sequences that are phylogenetically different from HBV genotype A-F molecules, useful for HBV diagnosis, prophylaxis and therapy

Claim 3; Fig 7; 94pp; English.

The invention relates to the complete nucleic acid sequence of a new human hepatitis B virus (HBV) genotype, provisionally named genotype G. This genotype was found with a high prevalence in patients chronically infected with HBV and residing in Europe and the USA. The invention relates to a fully defined sequence of 3248 nucleotides as given in specification, a sequence with 92% identity to the given sequence, or sequence that is degenerate to the mentioned sequences. These polynucleotides are useful for HBV genotyping. The proteins encoded by the polynucleotides are useful for detecting antibodies directed against the proteins are useful for detecting antibodies directed against the proteins are useful for detecting the proteins and for detecting the proteins and for detecting the proteins and for medicament for treating HBV are also useful for preparing a vectime or medicament for treating HBV infections. The present sequence is provided in an alignment of precore/Core sequences of an HBV genotype A strain (HBVXCRS) and 7 strains (FRI, FRZ, USI, US3, US1, US3, USG, US7, US9, USIO) of HBV genotype G

```
The invention relates to the complete nucleic acid sequence of a new human hepatitis B virus (HBV) genotype, provisionally named genotype G. This genotype was found with a high prevalence in patients chronically infected with HBV and residing in Europe and the UGA. The invention relates to a fully defined sequence of 3248 nucleotides as given in specification, a sequence with 92% identity to the given sequence, or specification, a degenerate to the Part of the proteins encoded by the polynucleotides are useful for HBV genotyping. The proteins encoded by the polynucleotides are useful for detecting antibodies in a biological cample. Ligands that bind to the proteins and antibodies directed against the proteins are useful for detecting the proteins and excise or medicament for treating HBV infections. The present sequence is provided in an alignment of precore/Core sequences of an HBV genotype A strain (HBVXCPS) and 7 strains (FRI, FR2, USI, US3,

The invention relates to the complete nucleic acid sequence of a new human hepatitis B virus (HBV) genotype, provisionally named genotype G. This genotype was found with a high prevalence in patients chronically infected with HBV and residing in Burope and the USA. The invention relates to a fully defined sequence of 3248 nucleotides as given in specification, a sequence with 92% identity to the given sequence, or sequence that is degenerate to the mentioned sequences. These polynucleotides are useful for HBV genotyping. The proteins encoded by the protucine are useful for detecting and antibodies in a biological sample. Ligands that bind to the proteins and antibodies in a biological the proteins are useful for detecting the proteins and for detecting HBCAS and HBCAS and HBCAS and HBCAS useful for medicament for treating HBV infections. The present sequence is provided in an alignment of precore/core sequences of an HBV genotype. A strain (HBVXCPS) and 7 strains (FR1, FR2, US1, US3, united the proteins are useful for an HBV genotype.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel isolated and/or purified hepatitis B virus polypeptide and polynucleotide sequences that are phylogenetically different from HBV genotype A-F molecules, useful for HBV diagnosis, prophylaxis and

```
The present sequence is the DNA sequence of the hepatitis B virus core antigen (HBCAg) gene from HBV serotype ayw. A peptide comprising a HBV protein can be used in claimed methods of the invention for modulating an immune response in a mammal. A method of inducing a systemic immune response to a peptide in a mammal comprises transmucosally administering cresponse to a peptide in a mammal comprises transmucosally administering conformal a macromolecular aggregate of the peptide. The macromolecular weight of over 1,000 kDa, and is preferably at least 5 nm in aggregate form by chemical treatment and/or by recombinant protein aggregate form by chemical treatment and/or by recombinant protein cagineering of the peptide. The peptide preferably comprises a HBV cortein selected from HBV surface protein, nucleocapsid protein or envelope protein. Transmucosal administration to a mammal or esponse in the mammal. A method of suppressing an immune response in the mammal. A method of suppressing an immune response in the mammal. A method of suppressing an immune response in the mammal. A method of suppressing an immune response in the mammal. A method of suppressing an immune response of that is resistant to digestive degradation and which may be stabilised by chemical treatment or protein engineering, and which may be derived from a HBV protein. A monomolecular peptide is useful for the induction of cral tolerance when inductions.

In cases of chronic infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0; Gaps 0;

Clones are derived from the mouse BAC library RPCI-23. For BAC
Library availability, please contact Pieter de Jong
(pieter@dejong.med.buffalo.edu). Clones may be purchased from
BACPAC Resources (http://bacpac.med.buffalo.edu/orderingframe.htm)
or from Resea ch Genetics (info@resgen.com). BAC end page:

The library was characterised by oligonucleotide fingerprinting
(NPF) to reduce sequencing redundancy. According to the ONFP
procedure, clones giving the same hybridisation pattern with a
battery of 200 Bmer oligonucleotides are grouped into clusters. One
clone per cluster is selected for sequencing. The size of each
cluster is an indicator of the frequency of a transcript in the
analysed library. The cluster size as well the coordinates of the
rest of the clones assigned to the same fingerprint cluster as the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Email: pouetka@molgen.mpg.de
The library was characterised by oligonucleotide fingerprinting
(ONF) to reduce sequencing redundancy. According to the ONF
procedure, clones that display the same hybridisation matrix with a
battery of 200 8mer oligonucleotides are grouped into clusters. One
clone per ONF cluster is selected for sequencing. The size of each
cluster is an indicator of the frequency of a transcript in the
analysed library. The cluster size as well as the coordinates of
the other clones assigned to the same ONF cluster as the clone from
which the above BST is generated is available at the sea urchin
project web site at: http://www.molgen.mpg.de/ag_seaurchin/ . cDNA
clones and filters are distributed via the Resource Center/Primary
Database of the German Human Genome Project (http://www.rzpd.de)

RESULT 3 AAT72562

The present sequence represents a synthetic oligonucleotide HBV46MYb which is complementary to a portion of the hepatitis B virus (HBV) RNA. The antisense oligonucleotide may be used to detect the presence of HBV in a sample. The antisense oligonucleotide, and oligonucleotides containing a sequence which is complementary to at least two noncontiguous regions of an HBV nucleic acid, may be used for inhibiting HBV replication in a cell or for the treatment of HBV infection

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a synthetic oligonucleotide HBV88b which is complementary to a portion of the hepatitis B virus (HBV) RNA. The antisense oligonucleotide may be used to detect the presence of HBV in a sample. The antisense oligonucleotide, and oligonucleotides containing a sequence which is complementary to at least two non-contiguous regions of an HBV nucleic acid, may be used for inhibiting HBV replication in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Oligo:nucleotide(s) complementary to hepatitis B virus (HBV) sequences used in the detection and treatment of HBV infection.

```
contains a sequence which is complementary to at least two non-contiguous regions of a hepatitis B virus (HBV) nucleic acid. The antisense oligonucleotide may be used to detect the presence of HBV in a sample. The antisense oligonucleotide, and oligonucleotides complementary to a portion of the HBV RNA, may be used for inhibiting HBV replication in a cell or for the treatment of HBV infection
                                                                                                                                                                                             present sequence represents a synthetic oligonucleotide HBV-89b which
                                                                                      Oligo:nucleotide(s) complementary to hepatitis B virus (HBV) sequences used in the detection and treatment of HBV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents a synthetic oligonucleotide HBV88Mb which list complementary to a portion of the hepartitis B virus (HBV) RM. The antisense oligonucleotide may be used to detect the presence of HBV in a sample. The antisense oligonucleotide, and oligonucleotides containing a sequence which is complementary to at least two non-contiguous regions of an HBV nucleic acid, may be used for inhibiting HBV replication in a cell or for the treatment of HBV infection
                                                                                                                                                                                                                                                                                                                                                                       Oligo:nucleotide(s) complementary to hepatitis B virus (HBV) sequences used in the detection and treatment of HBV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /*tag= a

The present invention describes a method of screening for an antiviral agent by the protein-priming activity of hepatitis B virus (HBV) DNA polymerase. Also described is developing an antiviral agent with a high selectivity to HBV which can be used for high-throughput screening. The present sequence represents an RNA oligonucleotide which is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Screening of antiviral agents by protein-priming activity of hepatitis virus DNA polymerase.

The antisense oligonucleotide may be used, odetect the presence of HBV in a sample. The antisense oligonucleotide, and oligonucleotides complementary to a portion of the HBV RNA, may be used for inhibiting HBV replication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Oligo:nucleotide(s) complementary to hepatitis B virus (HBV) sequences used in the detection and treatment of HBV infection.

The present invention relates to hepatitis B virus (HBV) strain FRI,
genotype G DNA encoding Precore/Core protein, HBpol, envelope (PreSI,
FreS2 and surface antigen HBsAg) and HBX proteins. HBv genotype G nucleic
acids and polypeptides are useful for diagnosing, prognosing and treating
infections caused by HBV genotype G. They can be used in a vaccine to
treat or prevent HBV genotype G infection. The HBV genotype G derived
nucleic acids and antibodies are useful for detecting HBV genotype G in a
sample or diagnosis of HBV genotype G infection. The presence of HBV
genotype G statistically correlates with the presence of Inver damage
and/or liver cancer in the subject. The HBV genotype G core insert
peptide encoding nucleic acid is useful for designing monitoring assays
to study and predict the evolution of anti-HBs and anti-HBs antibodies
antibodies or antigens of HBV genotype G are useful for identifying a
stable inver disease caused by HBV genotype G. The present sequence is
a hepatitis B virus (HBV) strain FRI, genotype G DNA fragment encoding e
antigen (HBeAg)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel hepatitis B virus genotype G, nucleic acids encoding virus, polypeptides encoded by nucleic acids, useful for preparing vaccine to treat or prevent the hepatitis B virus genotype G infection in a subject.

The present invention relates to hepatitis B virus (HBV) strain FR1, genotype G DNA encoding PreCore/Core protein, HBpol, envelope (PreS1, PreS2 and sutface antigen HBBAG) and HBX proteins. HBV genotype G nucleic acids and subsections are useful for diagnosing, prognosing and treating infections caused by HBV genotype G. They can be used in a vaccine to infection caused by HBV genotype G infection. The HBV genotype G derived nucleic acids and antibodies are useful for detecting HBV genotype G infection. The HBV genotype G infection. The presence of HBV genotype G infection. The presence of HBV can proposed of a sample or diagnosis of HBV genotype G infection. The presence of liver damage and/or liver cancer in the subject. The HBV genotype G core insert peptide encoding nucleic acid is useful for designing monitoring assays to study and predict the evolution of anti-HBe and anti-HBc antibodies to antibodies or antigens of HBV genotype G are useful for identifying a stage of liver disease caused by HBV genotype G. The present sequence is a hepatitis B virus (HBV) strain FR1, genotype G DNA fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to modified proteins comprising hepatitis B virus (HBV) core antigen (HBCAg) wherein one or more of the four arginine repeats has been deleted and the protein comprising the C-terminal cysteine of HBCAg. The deleted region may be replaced by an epitope from a protein other than HBCAg, in which case the HBCAg acts as a carrier to present the epitope to the immune system. This chimeric protein or its nucleic acid is useful as a vaccine or in a method of prophylactic or therapeutic vaccination of the human or animal body, particularly against HBV. The nucleic acid encoding the protein may be used in gene therapy or DNA vaccination protocols. The chimeric protein or its nucleic acid may also be used as the basis of a prophylactic vaccine against a range of diseases, e.g. HBV, hepatitis A virus (HAV), hepatitis C virus (HCV), influenza, foot-and-mouth disease, polio, herpes, rabise, acquired immunodeficiency syndrome (AIDS), dengue fever, yellow fever, malaria, tuberulosis, whooping cough, salmonallosis, typhoid, food poisoning, diarrhoea, meningitis or gonorrhea. The present sequence is a DNA chocking Hepatitis B virus core antigen (HBCAG)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New proteins comprising a modified hepatitis B core antigen, useful as a vaccine in prophylactic or therapeutic vaccination of the human or animal body, particularly against hepatitis B virus infection.

The present invention relates to hepatitis B virus (HBV) core antigen (HBCAG) fusion proteins and polymucleotides encoding such proteins. Sequences of the invention are useful in methods of prophylactic or therapeutic vaccination or manufacture medicaments for prophylactic or therapeutic vaccination of the human or animal body against HBV, e.g. against viral hepatitis. They are also useful as a prophylactic vaccine against e.g. hepatitis c virus, influenza, polio, herpes, rabies, acquired immune deficiency syndrome (AIDS) or foot-and-mouth disease. The present sequence is a DNA encoding hepatitis B virus core antigen (HBCAG)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Hepatitis B (HB) core antigen fusion proteins, useful as vaccines for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         prophylactic or therapeutic treatment of humans or animals against e.g. HB virus, viral hepatitis, hepatitis C virus, influenza, or foot-andmouth disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Hepatitis B virus; HBV; preCore; Core; preSl; preS2; HBS; HBX; HBPol;

sample. Ligands that bind to the proteins and antibodies directed against the proteins are useful for detecting the proteins and for detecting HBCAG and HBCAG (precore precursor proteins). They are also useful for preparing a vaccine or medicament for treating HBV infections. The present sequence is provided in an alignment of precore/Core sequences of an HBV genotype A strain (HBVXCPS) and 7 strains (FRI, FR2, US1, US3, US6, US7, US9, US10) of HBV genotype G
                                                                                                                                                                                                                                                                                                                                                                               The invention relates to the complete nucleic acid sequence of a new human hepatitis B virus (HBV) genotype, provisionally named genotype G. This genotype was found with a high prevalence in patients chronically infected with HBV and residing in Europe and the USA. The invention relates to a fully defined sequence of 3248 nucleotides as given in sequence with 92% identity to the given sequence, or sequence that is degenerate to the mentioned sequences. These polynucleotides are useful for HBV genotyping. The proteins encoded by the polynucleotides are useful for detecting antibodies in a biological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Hepatitis B virus; HBV; preCore; Core; preSl; preS2; HBS; HBX; HBPOl;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to the complete nucleic acid sequence of a new human hepatitis B virus (HBV) genotype, provisionally named genotype G. This genotype was found with a high prevalence in patients chronically infected with HBV and residing in Europe and the UGA. The invention relates to a fully defined sequence of 3248 nucleotides as given in specification, a sequence with 92% identity to the given sequence, or specification, a sequence with 92% identity to the given sequence, or olynucleotides are useful for HBW genotyping. The proteins encoded by the polynucleotides are useful for detecting antibodies directed against the proteins are useful for the proteins and for detecting the proteins and for detecting the proteins and for detecting the proteins and vaccine or medicament for treating HBV infections. The present sequence is provided in an alignment of precore/Core sequences of an HBV genotype A strain (HBVXCPS) and 7 strains (FRI, FRZ, USI, US3, USG, US7, US9, USIO) of HBV genotype G

HBV

Novel isolated and/or purified hepatitis B virus polypeptide and polynucleotide sequences that are phylogenetically different from genotype A-F molecules, useful for HBV diagnosis, prophylaxis and

therapy

De Gendt S;

WPI; 2001-374785/39.

```
This genotype was found with a high prevalence in patients fortonically infected with HBV and residing in Europe and the USA. The invention relates to a fully defined sequence of 3248 nucleotides as given in specification, a sequence with 92% identity to the given sequence, or sequence that is degenerate to the mentioned sequence. These polynucleotides are useful for HBV genotyping. The proteins encoded by the polynucleotides are useful for detecting antibodies in a biological sample. Ligands that bind to the proteins and antibodies directed against the proteins are useful for detecting the proteins and for detecting the proteins and for detecting reparing a vaccine or medicament for treating HBV infections. The preparing a vaccine or medicament for treating HBV infections. The an HBV genotype A strain (HBVXCPS) and 7 strains (FRI, FRZ, USI, USS, USI, USS, USI, USS).
                                                                                 invention relates to the complete nucleic acid sequence of a new
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 655 BP; 144 A; 156 C; 143 G; 206 T; 0 U; 6 Other;

Novel isolated and/or purified hepatitis B virus polypeptide and polynucleotide sequences that are phylogenetically different from HBV genotype A-F molecules, useful for HBV diagnosis, prophylaxis and therapy

Claim 3; Fig 7; 94pp; English.

The invention relates to the complete nucleic acid sequence of a new human hepatitis B virus (HBV) genotype, provisionally named genotype G. This genotype was found with a high prevalence in patients chronically infected with HBV and residing in Burope and the USA. The invention

relates to a fully defined sequence of 3248 nucleotides as given in 888888888888888

Sequence 655 BP; 144 A; 156 C; 143 G; 206 T; 0 U; 6 Other;

Submitted Jan. 13. Mar. 2004) Weisshaar B., Max-Planck-Institut fuer Submitted (31-MAR. 2004) Weisshaar B., Max-Planck-Institut fuer Zuechtungsforschung, Carl-von-Linne-Weg 10, Koeln, 50829, Germany This sequence has been recovered from the left border of the T-DNA. It indicates an insertion within the locus defined by BAC clone fast33. Details on the protocols used for generation of the sequence are described in References 1-3. The sequences are generated at the MPI for plant Breeding Research in the context of the GABI-Kat project. GABI-Kat is part of the German Plant Genomics program designated 'GABI'. Information on line availability can be found at: http://www.mpiz-koeln.mpg.de/GABI-Kat/.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /note="PCR was performed on DNA from Arabidopsis thaliana plants (T1) which were transformed with the T-DNA from vector pAC161 (GenBank accession number: AJ537514). The lines contain one or more T-DNA insertions. The DNA fragment(s) resulting from the PCR were directly sequenced to determine the genomic sequence flanking the insertion. T-DNA derived sequences were removed."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            2.2 ug of total RNA, treated with T4 DNA polymerase, and purified by ethanol-precipitation. The cDNAs were ligated to Lone-linker LL-Sal4, purified by phenol/chloroform, and separated from free linkers by Centricon 100. Then, the CDNAs were amplified by Long-range high fidelity PCR using Ex Tag polymerase (Takara) with a primer Sal4.5. The products were purified by phenol/chloroform and Centricon 100. The CDNAs were digested with Sal1 and No11 enzymes and cloned into Sal1/Not1 site of pCMV-SPORT6 plasmid vector. The DH108 E. coli host was transformed with the ligation mixture by the standard chemical method. The average insert size is about 2.5 kb. The library was constructed by Yulan Piao.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /note="Vector: pCWV-SPORT6 (Invitrogen); Site 1: Sall; Site 2: Not1; Mouse cDNA project by the Laboratory of Genetics. National Institute on Asing (NIA), Intramural Research Program, NIH (http://logun.grc.nia.nih.gov/cDNA). This is a long-transcript enriched cDNA library (Ref. Genome Res. 11: 153-1558 (2001). [PMID: 11544199]). Total RNAs were obtained from Dr. Akihiro Umczawa (Keio University School of Medicine, Japan). Double-stranded cDNAs were synthesized with an Oligo (dT) primer

Email: sequences cons.fr, Web : www.genoscope.cns.fr
The sequences are based on single pass reads.
Life Technologies (a division of Invitrogen) members carried out
full-length libraties construction: Temple G.
Genoscope members carried out sequencing and annotation: Castelli
V., Aury J.M., Jaillon O., Wincker P., Menard M., Cruaud C.,
Schachter V., Weissenbach J., Salanoubat M.
URGV INRA: Clepet C., Caboche M.
Annotation is based on the June 2003 version of the Arabidopsis
genome released by MIPS (Munich Information center for Protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AQ183243 120 MR CIT Approved Human Genomic Sperm Library D Homo saplens genomic clone Plate=3140 Col=4 Row=D, genomic survey

Laboratory Mouse DNR Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonicleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114] gb|AR129072.1), a copy.number inducible derivative of plasmid R1. The vector was ligated with adaptore complementary to the insert adaptore and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AK015232 509 bp mRNA linear HTC 03-APR-2004 Mus musculus adult male testis cDNA, RIKEN full-length enriched library, clone:4930429C20 product:unclassifiable, full insert
